

Energy Surveys Ltd. are now offering Thermal Imaging

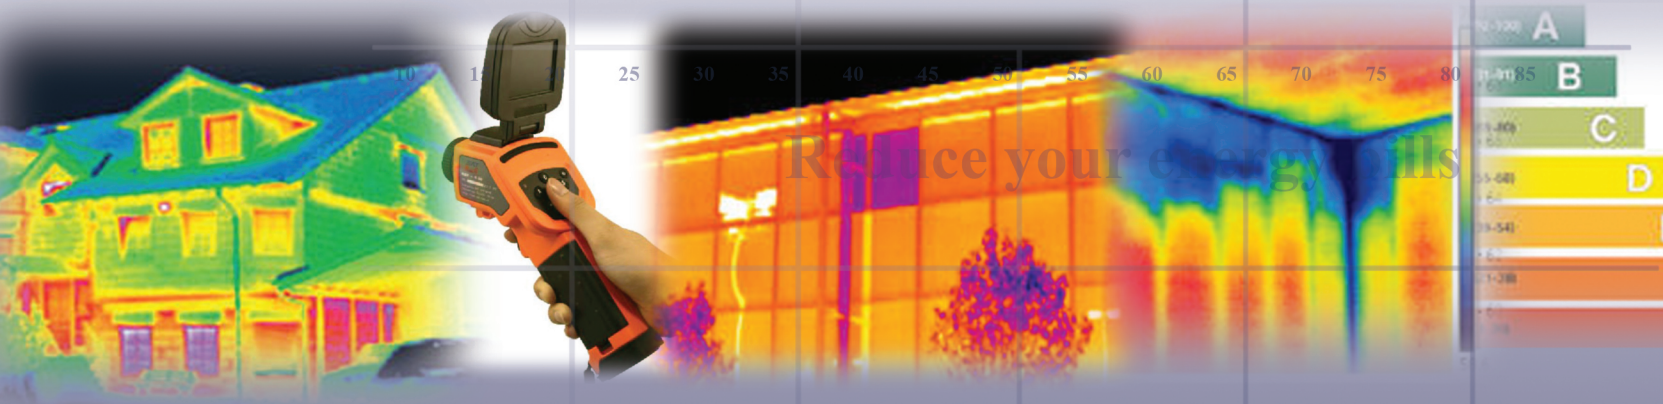

Thermal Imaging – *What is it?*

Thermal Imaging gives a visual representation of cold areas in a building where heat is lost due to poor building practice or structural defects. This is done by using infrared images from a thermal image camera.

Thermal imaging works hand in hand with air tightness testing by giving you a visual illustration of the problem areas as detected by the blower door test.

All BER & Air Tightness Assessments and Surveys are carried out by Experienced and Qualified personnel who are Authorised Energy Assessors, fully Accredited by SEI.

Energy Surveys Ltd. are now offering Thermal Imaging

What are the benefits of Thermal Imaging?

- ✓ real time capture of heat loss.
- ✓ the ability to see things that are invisible to the naked eye.
- ✓ highlights the extent of the heat loss- it does not merely identify that heat loss is occurring, it also indicates the level of heat loss experienced.
- ✓ identifies defects in a building that lead to unnecessary heat loss.
- ✓ money can be saved by dealing with the issues that are identified by the thermal imaging report.
